EXECUTIVE SUMMARY | FOR GOVERNMENT STAKEHOLDERS

Who learns on EduPro, and what they choose

Vaishnavi Sarodey | Unified Mentor | 24 October 2026

EduPro serves **2,762 active learners** who made **7,516 course enrollments** across 64 courses. This summary explains, in plain terms, who those learners are, what they choose, and what the platform should do with that knowledge. It describes the present learner base; it does not forecast or measure revenue.

Total Enrollments	Active Learners	Courses / Learner
7,516	2,762	2.72

Top Age Group	Top Category	Top Level
26-35	Programming	Beginner

Figure 1. Headline indicators.

What we found

- **Age.** The **26-35** age group is the most active, with 41% of all enrollments. The smallest group, 46+, supplies 3%.
- **Gender.** Learners are 54% Male and 43% Female.
- **Subjects. Programming** is the most popular category (24% of enrollments); **Personal Development** is the least (9%).
- **Skill level.** Beginner courses are the most chosen (44%).
- **Engagement.** A learner takes 2.7 courses on average. The most active 20% of learners account for 40% of enrollments, and 30% of learners have taken just one course.

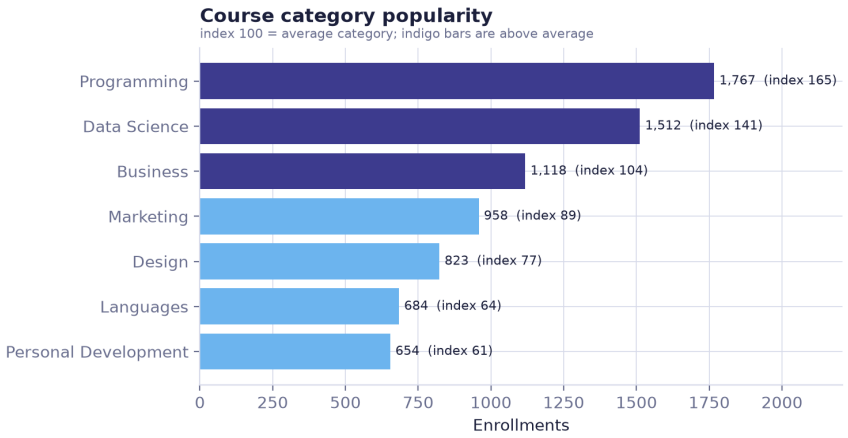

Figure 2. Which course categories attract the most enrollments.

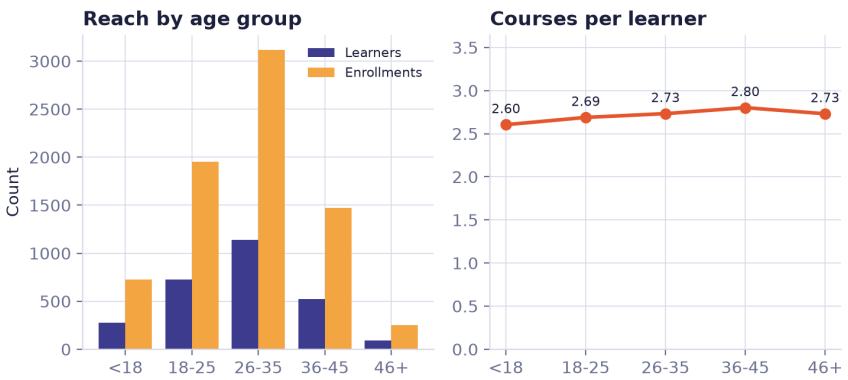

Figure 3. Which age groups are most active.

What it means and what to do next

Who prefers what

Learner group	Learners	Most chosen category	Most distinctive choice	Preferred level
Age <18	278	Programming	Languages	Beginner
Age 18-25	726	Programming	Programming	Beginner
Age 26-35	1,140	Programming	Data Science	Beginner
Age 36-45	525	Business	Business	Beginner
Age 46+	93	Languages	Languages	Beginner
Gender Male	1,487	Programming	Data Science	Beginner
Gender Female	1,200	Programming	Languages	Beginner
Gender Other	75	Programming	Languages	Beginner

Most distinctive choice is the category a group picks far more often than the platform average.

What this means

Different age groups lean towards different subjects, so one message for everyone will under-serve some of them. Men and women choose subjects very similarly; the main gender difference is in *how many* of each join, not what they study.

Recommended actions

- **Invest where demand is proven.** Keep Programming strong and add courses in Programming, where each course attracts the most learners.
- **Review Personal Development.** Decide whether to improve, promote or retire it.
- **Reach every age group.** Tailor outreach to each group's favourite subject, and run a targeted effort for the smallest group (46+).
- **Support inclusion.** Aim awareness efforts at the age groups where the smaller gender group is thinnest.
- **Keep learners learning.** Offer clear next-course pathways to the 30% who have taken only one course.
- **Measure every quarter.** Track the five indicators (total enrollments, enrollments by age group, gender participation ratio, category popularity, level preference) so decisions stay evidence-based.

About the data

The analysis joins the Users, Courses and Transactions records (7,516 enrollments, Jan 2023 to Jun 2025). Records were checked for duplicates, broken links and invalid values before use. Findings describe associations between learner groups and choices, not causes. Learners are grouped as <18, 18-25, 26-35, 36-45 and 46+.

Next step

Approve a pilot that applies the age-targeted outreach and next-course pathways above, and review the five indicators after one quarter to see what changed.
